

Utilize ACL to set menu items and permissions

Describe how to set up a menu item and permissions.

menu.xml - `urn:magento:module:Magento_Backend:/etc/menu.xsd` - flat structure

```
<menu>
  <add id="Module_Alias::item_name" title="Title" translate="title"
  module="Module_Alias" sortOrder="30"
    parent="Magento_Backend::system_design" action="adminhtml/system_design"
  resource="Magento_Backend::schedule"
    dependsOnConfig="" dependsOnModule="" sortOrder="" target="" tooltip=""
  />
  <update id="Module_Alias::item_name" [all normal params] />
  <remove id="Module_Alias::item_name" />
</menu>
```

How would you add a new tab in the Admin menu?

- don't specify parent and action

How would you add a new menu item in a given tab?

- just set one of top level parents, e.g. 'Magento_Backend::system'

How do menu items relate to ACL permissions?
